ENTOUCHE

Inventory Management System

User Guide

A practical guide for day-to-day inventory, warehouse, reporting, and administrative operations.

Organization	Entouche
System	Entouche Inventory Management System (IMS)
Version	1.0
Year	2026

Designed & developed by **Skiplab Innovation**

1. Introduction

The Entouche Inventory Management System (IMS) is a centralized web application for managing inventory and warehouse operations. It provides controlled workflows for items, receipts, transfers, adjustments, stock counts, reporting, users and roles, data import, notifications, and operational visibility.
This guide is written for everyday users of the system. The screens and actions visible to each person may differ according to the permissions assigned to their role.

2. User Roles

Role	Typical Responsibility
System Administrator	System administration, users and roles, configuration, and broad operational access.
Warehouse Manager	Warehouse operations, review/approval activities, inventory oversight, and reporting.
Inventory Officer	Day-to-day inventory activities such as receipts, transfers, adjustments, stock counts, and item maintenance where permitted.
Management Viewer	Read-only or management-oriented visibility into inventory operations and reports, according to assigned permissions.

3. Signing In and Navigating the System

1. Open the IMS - Use the Entouche IMS web address supplied by your administrator.

2. Sign in - Enter your authorized email address and password.

3. Use the sidebar - Select Dashboard, Items, Inventory, Warehouse, Reports, or another module available to your role.

4. Use search and filters - Where available, search by item, transaction, user, warehouse, location, status, or date to narrow the records shown.

4. Dashboard

The Dashboard provides a high-level view of inventory activity and items requiring attention. Use it as the starting point for understanding the current operational state before moving into detailed modules.

- Review inventory and operational summary cards.
- Check alerts or notifications that require attention.
- Use dashboard information to identify records that need follow-up.

5. Items

The Items module contains the master records for products or materials tracked by the IMS. Inventory transactions reference these item records.

1. Open Items - Select Items from the sidebar.

2. Search before creating - Confirm that the item does not already exist to avoid duplicate records.

3. Create or edit an item - Enter the required item information, classification, unit information, inventory thresholds, and other available fields.

4. Save and verify - Confirm that the record appears correctly before using it in inventory operations.

6. Inventory Module

The Inventory module is the operational core of the IMS. Inventory changes should occur through controlled workflows rather than by manually changing stock balances.

6.1 Transactions

Transactions provide a consolidated history of inventory movements. Use this area to investigate how stock changed and to review the type, quantity, date, and related movement information.

- Search or filter transactions to locate a specific movement.
- Use transaction history when investigating discrepancies.
- Do not treat the transaction list as a data-entry screen, it represents the history produced by inventory operations.

6.2 Receipts

Receipts are used when goods enter the warehouse.

1. Create a receipt - Enter the receipt information and add the relevant items and quantities.

2. Review the draft - Verify item, quantity, supplier/reference, warehouse, and other required information.

3. Submit - Submit the receipt when it is ready for review.

4. Approve - An authorized user reviews and approves the receipt.

5. Receive - Complete the receiving process so the approved goods are reflected in inventory.

Workflow: A typical receipt progresses from Draft → Submitted → Approved → Received. Cancellation may be available before completion, depending on the record state and user permissions.

6.3 Transfers

Transfers control the movement of stock between approved warehouse locations.

1. Create a transfer - Select the source, destination, items, and quantities.

2. Verify availability - Confirm that the source has the required stock and that the destination is correct.

3. Submit for approval - Move the transfer into the approval workflow.

4. Approve - An authorized user reviews the transfer.

5. Complete - Complete the transfer after the physical movement has taken place.

Workflow: A typical transfer progresses from Draft → Pending Approval → Approved → Completed.

6.4 Adjustments

Adjustments are used to correct inventory when the recorded quantity needs to be changed for a legitimate operational reason, such as damage, loss, or a discovered recording error.

1. Create the adjustment - Select the item and enter the required quantity change.

2. Provide the reason - Record a clear reason so the change can be understood later.

3. Submit/review - Follow the approval process available to your role.

4. Approve - Once approved, the adjustment updates inventory and becomes part of the stock movement history.

Important: Do not use adjustments as a shortcut for normal receiving or transfer activity. Use the workflow that reflects what physically happened.

6.5 Stock Counts

Stock Counts compare the quantity recorded by the IMS with the quantity physically present in the warehouse. The system can highlight variances for review and reconciliation.

1. Create a stock count - Choose the warehouse/location, count type, and items to be counted.

2. Request/start the count - Move the count into the active counting process.

3. Enter physical quantities - Record what was counted for each item.

4. Review variances - Compare system quantities with counted quantities and investigate discrepancies.

5. Submit for review - Send the completed count for authorized review.

6. Complete/reconcile - After approval, complete the process so accepted variances are reconciled.

Workflow: The implemented stock-count process can progress through Draft → Requested → In Progress → Pending Review → Completed. Rejected counts may return to Draft, while a recount can be requested when

verification is required.

7. Warehouse Management

The Warehouse area is used to view and manage the warehouse structure and its locations, according to the user's permissions. Accurate warehouse/location setup is important because receipts, transfers, and stock counts depend on it.

- Confirm the correct warehouse and location before processing inventory.
- Avoid creating duplicate locations with slightly different names.
- Only authorized users should change warehouse configuration.

8. Reports

Reports provide management and operational users with structured visibility into inventory activity. Use available filters to focus on the period, warehouse, item, or activity relevant to the question being investigated.

1. Open Reports - Choose the report required for the task.

2. Apply filters - Select the appropriate dates and other available filters.

3. Review results - Confirm that the report scope is correct before using the information for decisions.

4. Export when needed - Use the available export option when a report needs to be shared or retained outside the IMS.

9. Data Import

Data Import is intended for authorized bulk-loading activities where entering records individually would be inefficient.

1. Prepare the source file - Use the expected import structure/template and review the data before upload.

2. Upload - Select the file in the Data Import module.

3. Review validation results - Check successful and failed rows rather than assuming every record was imported.

4. Correct failures - Fix invalid rows and re-import only as appropriate.

10. Users, Roles, and Permissions

Access to IMS functions is controlled through user roles and permissions. System Administrators should assign the minimum level of access required for each person's responsibilities.

- Create a separate account for each user.
- Assign the role that matches the user's operational responsibility.
- Review access when a person's job responsibilities change.
- Deactivate access when a user should no longer use the system.

Control principle: Approval permissions should be reserved for personnel authorized to review and approve inventory operations.

11. Notifications

The IMS uses notifications to draw attention to relevant operational events. Depending on configuration, notifications may appear in the application and/or be delivered by email.

- Review notifications regularly.
- Open the related record before taking action.
- Do not rely on notification text alone when approval or investigation is required.

12. Audit and Operational Visibility

The system provides operational visibility into user and inventory activity. This helps management investigate changes, understand who performed an action, and maintain accountability.

- Use activity information when investigating inventory discrepancies.
- Ensure staff use their own accounts so activity can be attributed correctly.
- Avoid sharing credentials or performing another user's work under your account.

13. Recommended Daily Operating Procedure

1. Start of day - Review the Dashboard and notifications for outstanding approvals, low-stock conditions, or other issues.

2. Receiving - Record incoming goods through Receipts rather than manually altering stock.

3. Movement - Use Transfers for authorized movement between locations.

4. Corrections - Use Adjustments only when a legitimate stock correction is required and document the reason.

5. Verification - Perform Stock Counts according to the organization's counting schedule and investigate variances.

6. Review - Use Transactions and Reports to confirm important movements and support operational decisions.

7. End of task - Verify that records have reached the correct workflow status and that no incomplete action was left unintentionally.

14. Common Statuses and What They Mean

Status	Meaning	User Action
Draft	The record is being prepared.	Review and complete required information.
Submitted / Pending Approval	The record is awaiting an authorized review.	Approver should verify the details before approval or rejection.
Approved	The operation has been authorized but may still require completion.	Complete the physical/operational step when appropriate.
In Progress	The activity is currently being performed.	Finish the required work and enter accurate results.
Pending Review	The activity requires review before finalization.	Review discrepancies and supporting information.
Completed / Received	The workflow has been finalized.	Use transaction/reporting history for subsequent review.
Cancelled	The workflow was stopped and should not proceed.	Create a new record if the operation must be restarted.

15. Troubleshooting

Issue	What to do
Cannot see a menu or action	Your role may not have permission. Confirm with the System Administrator.
Cannot complete an approval	Check the current workflow status and confirm that your role has approval permission.
Inventory quantity looks incorrect	Review Transactions, Receipts, Transfers, Adjustments, and recent Stock Counts before making a correction.
Import contains failed rows	Review the validation/error information, correct the source data, and retry the affected records.
Page does not update as expected	Refresh the page and verify your network connection. If the issue continues, record the screen, action, and error message for support.

16. Best Practices

- Search for existing records before creating new ones.
- Verify item, quantity, warehouse, and location before submitting inventory operations.
- Use clear reasons and notes for adjustments and exceptional activities.
- Do not bypass approval workflows by making unrelated stock changes.
- Investigate stock-count variances before final reconciliation.
- Use reports and transaction history when validating inventory activity.
- Keep login credentials private and use only your assigned account.
- Report unexpected system behavior with the exact action, record number, and error message.

17. Quick Workflow Reference

Business Need	Use
Add incoming stock	Receipts
Move stock between locations	Transfers
Correct stock because of damage, loss, or recording error	Adjustments
Verify physical stock against system stock	Stock Counts
Investigate how inventory changed	Transactions
Create or maintain product/material records	Items
Review operational information	Dashboard / Reports
Bulk-load supported records	Data Import
Manage access	Users & Roles

18. Support and Change Management

Users should report system issues through the support process established by Entouche. When reporting a problem, include the module, record number (if applicable), steps taken, expected result, actual result, and a screenshot of any error.

Changes to workflows, roles, permissions, warehouse configuration, or other system-wide settings should be coordinated with authorized Entouche personnel before implementation.
